

# Answers to Even-numbered Exercises

---

# 24

2. What kind of DNS record is likely to be returned when a Web browser tries to resolve the domain part of a URI?

An A (or Address) record points to a domain.

4. How would you find the IP address of example.com from the command line?

```
$ hostname example.com
```

or

```
$ dig example.com
```

6. How would you instruct a DNS server to respond only to queries from the 137.44.\* IP range?

Add the following line to the Options section in `/etc/named.conf`:

```
allow-query { 137.44.0.0/24 };
```

8. How would you start to set up a private domain name hierarchy that does not include any of the official InterNIC-assigned domain names?

Set up a DNS cache which defines the zone `.` (period) section explicitly, rather than relying on the hint file.

10. It is often irritating to have to wait for DNS records to update around the world when you change DNS entries. You could prevent this delay by setting the TTL to a small number. Why is setting the TTL to a small number a bad idea?

Setting the TTL to a small number prevents DNS caches from caching your DNS entries. This would place a large load on your DNS server because every query about your domain would be forwarded to your server.
