7

ANSWERS TO EVEN-NUMBERED EXERCISES

2. Using sort as a filter, rewrite the following sequence of commands:

```
$ sort list > temp
$ lpr temp
$ rm temp

$ cat list | sort | lpr
```

4. Assume that the following files are in the working directory:

```
$ ls
intro      notesb     ref2      section1   section3   section4b
notesa     ref1       ref3      section2   section4a  sentrev
```

Give commands for each of the following, using wildcards to express filenames with as few characters as possible.

a. List all files that begin with **section**.

```
$ ls section*
```

b. List the **section1**, **section2**, and **section3** files only.

```
$ ls section[1-3]
```

c. List the **intro** file only.

```
$ ls i*
```

d. List the **section1**, **section3**, **ref1**, and **ref3** files.

```
$ ls *[13]
```

6. Give a command to

   a. Redirect standard output from a sort command to a file named
      phone_list. Assume the input file is named **numbers**.

      ```
      $ sort numbers > phone_list
      ```

   b. Translate all occurrences of the characters [and { to the character (, and
      all occurrences of the characters] and } to the character) in the file
      permdemos.c. (*Hint:* Refer to the tr man page.)

      ```
      $ cat permdemos.c | tr '[{}]' '(())' or
      $ tr '[{}]' '(())' < permdemos.c
      ```

   c. Create a file named **book** that contains the contents of two other files:
      part1 and **part2**.

      ```
      $ cat part[12] > book
      ```

8. Give an example of a command that uses grep

   a. With both input and output redirected.

      ```
      $ grep \$Id < *.c > id_list
      ```

   b. With only input redirected.

      ```
      $ grep -i suzi < addresses
      ```

   c. With only output redirected.

      ```
      $ grep -il memo *.txt > memoranda_files
      ```

   d. Within a pipe.

      ```
      $ file /usr/bin/* | grep "Again shell script" | sort -r
      ```

   In which of the preceding cases is grep used as a filter?

   Part **d** uses grep as a filter.

10. When you use the redirect output symbol (>) with a command, the shell
    creates the output file immediately, before the command is executed.
    Demonstrate that this is true.

    ```
    $ ls aaa
    ls: aaa: No such file or directory
    $ ls xxxxx > aaa
    ls: xxxxx: No such file or directory
    $ ls aaa
    aaa
    ```

    The first command shows the file **aaa** does not exist in the working
    directory. The second command uses ls to attempt to list a nonexistent file

(**xxxxx**) and sends standard output to **aaa**. The ls command fails and sends an error message to standard error (i.e., displays it on the screen). Even though the ls command failed, the empty file named **aaa** exists. Because the ls command failed, it did not create the file; the shell created it before calling ls.

12. Assume your permissions allow you to write to a file but not to delete it.

a. Give a command to empty the file without invoking an editor.

```
$ filename < /dev/null or
$ cat /dev/null > filename
```

b. Explain how you might have permission to modify a file that you cannot delete.

To delete a file, you must have write and execute permission for the directory housing the file. To write to a file, you must have write permission for the file and execute permission for the parent directory. When you have write permission only for a file and execute permission only for the directory holding the file, you can modify but not delete the file.

14. Why does the **noclobber** variable *not* protect you from overwriting an existing file with cp or mv?

The **noclobber** variable keeps the shell from overwriting a file and does not work on utilities. Thus it keeps a redirect symbol (**>**) from allowing the shell to overwrite a file (the shell redirects output) but has no effect when you ask cp or mv to overwrite a file.

16. Create a file named **answer** and give the following command:

```
$ > answers.0102 < answer cat
```

Explain what the command does and why. What is a more conventional way of expressing this command?

Reading the command line from left to right, it instructs the shell to redirect standard output to **answers.0102**, redirect standard input to come from **answer**, and execute the cat utility. More conventionally, the same command is expressed as

```
$ cat answer > answers.0102
```
